

domovari - *mineral matt*

mineral matt is a solid surface material. It is high-quality, colour-through and homogeneous. With an appearance and feel similar to stone, mineral matt combines the natural advantages of a mineral with the wide-ranging possibilities of technical resins. The result is a material that is flexible in design and extremely easy to care for.

DAILY CLEANING

For the daily care of the solid surface material, we recommend the use of standard household cleaners. The surface of the material is completely resilient, so there is no risk of damaging it during routine cleaning.

HEAVIER SOILING AND LIMESCALE

To remove heavier soiling, burn marks or felt-tip stains without leaving traces, the surface can be treated with a liquid cream cleaner or a cleaning stone. This method produces a very fine abrasion of the surface, revealing a new, untouched layer of material beneath.

Limescale stains, which may appear as yellowish discolouration on pure white mineral matt surfaces, can be dissolved with standard bathroom cleaners or vinegar essence and then wiped away effortlessly.

COSMETICS, CHEMICALS AND DISCOLOURATION

The mineral matt material is resistant to cosmetics and to most chemicals commonly used in households and laboratories. Even nail polish remover or hair dye pose no issue; any potential discolouration can be removed with liquid cream cleaner or a cleaning stone and a sponge. On pure white surfaces, discolouration can even be removed with chlorine-based cleaners.

If the care recommendations do not produce the desired results, or if the damage is more severe, mineral matt can still be fully repaired even after installation.
